# Outline

- **Stage I study: CO<sub>2</sub> injection into a depleted gas reservoir**
- **Numerical simulations and pre base line tests**
- **Seismic monitoring program**
- **Data acquisition**
- **Results**
- **Final modelling**
- **Conclusions**

# CO2CRC Otway Project (Victoria, Australia)

Stage II injection

Stage I injection

**STAGE I: An 80/20 % of CO<sub>2</sub>/CH<sub>4</sub> stream produced from Buttres, transported and injected into CRC-1 well (previous gas production well)**

**STAGE II: CO<sub>2</sub>/CH<sub>4</sub> stream injected into CRC-2 well(huff-and-puff) – up to 10 Kt.**

# Naylor field, Otway

- **Unique test site (relevant for EHR)**
- **Infrastructure in place, natural CO<sub>2</sub> accumulations**
- **Opportunity to develop M&V strategies for several different reservoirs**
- **Current (phase I) CO<sub>2</sub> storage involves deeper, depleted gas field (Naylor), highly porous and permeable formation**
- **Opportunity to devise appropriate methodology that can be applied to CO<sub>2</sub> storage in depleted gas reservoirs**

# The reservoir

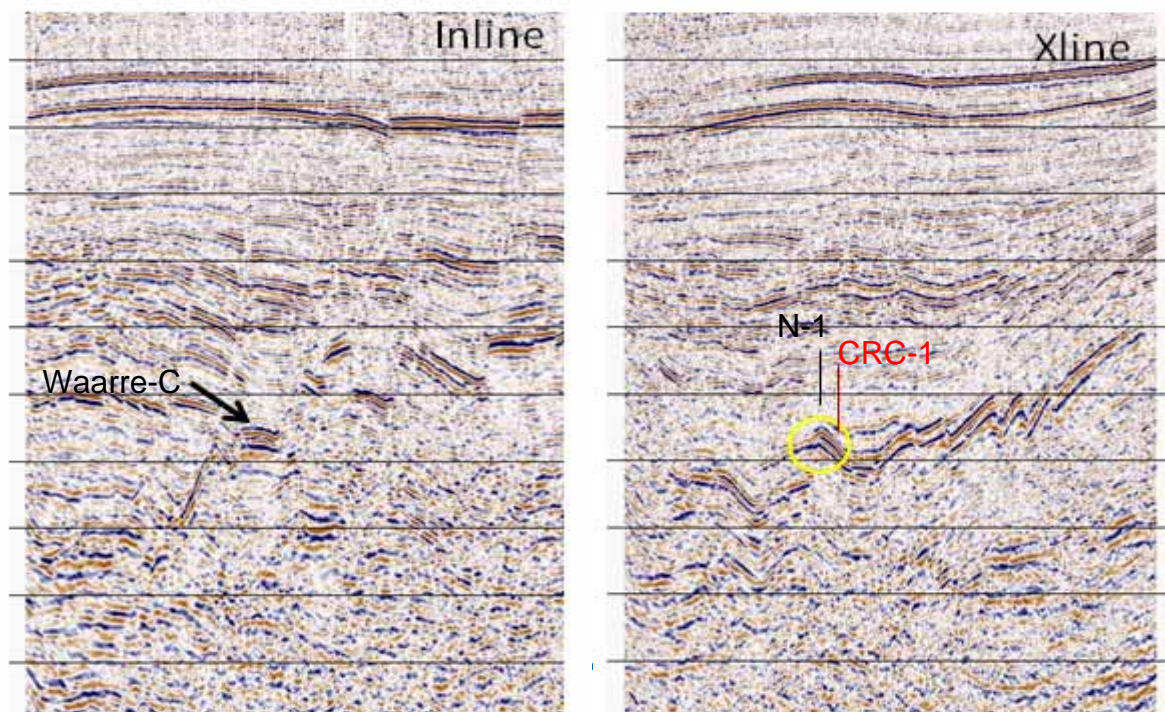

Small, thin, heterogeneous and deep depleted gas reservoir, surrounded by complex faulting,

CO<sub>2</sub>/CH<sub>4</sub> – mix injected and monitored with the most sensitive seismic techniques

**Naylor gas field**

Pre-production 3D seismic data recorded in 2000

# Geophysical monitoring

Only time lapse (TL) seismic methods – great penetration, resolution

## Issues:

Expect small changes of the elastic properties of the reservoir due to  $\text{CO}_2/\text{CH}_4$  mix injection – saturation changes mainly (subtle TL signal)

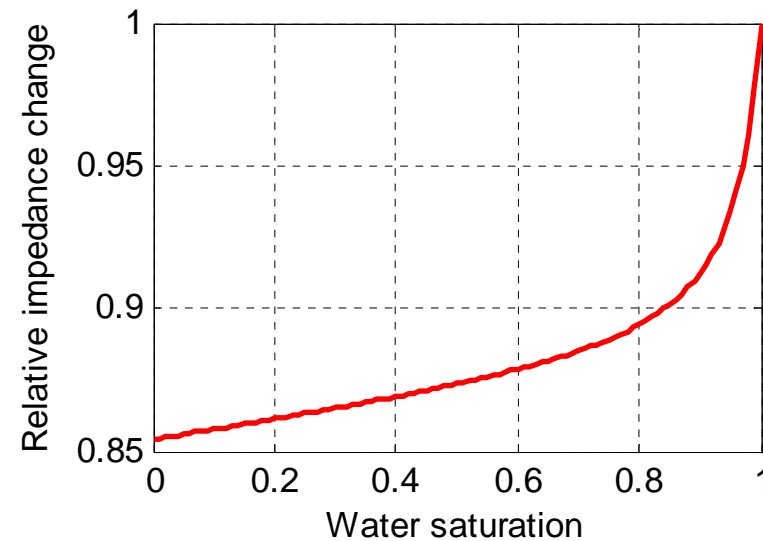

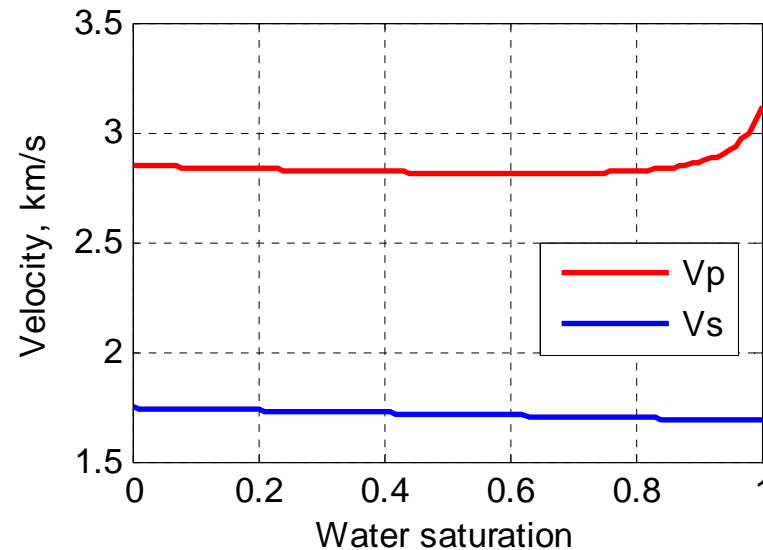

Traditionally poor repeatability of land seismic surveys + accessibility, environmental restrictions, cost, etc...

Copyright CO2CRC

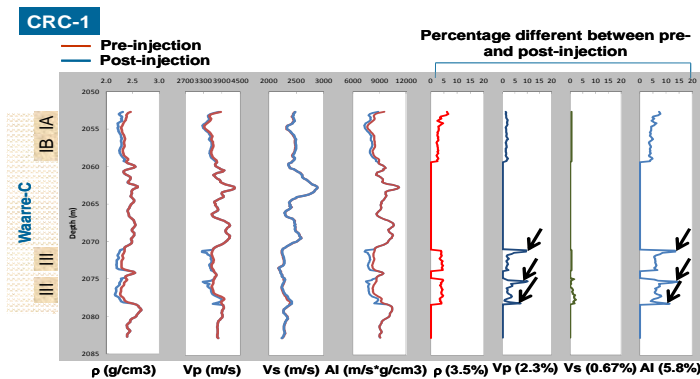

# Changes of rock properties due to fluid substitution – homogeneous model

Injection of CO<sub>2</sub> in supercritical form into saline aquifer with 25% porosity

# Modelling/predicting TL seismic effect due to CO<sub>2</sub>/CH<sub>4</sub> mix injection into Waarre-C

Computed changes in elastic properties including acoustic impedance for two wells. In both cases impedance changes up to 6%; density dominated; very small change

**For  $\Delta AI \sim 6\%$  Max,  $\Delta R$  up to 15%. If NMRs < 20%...**

## Challenging...

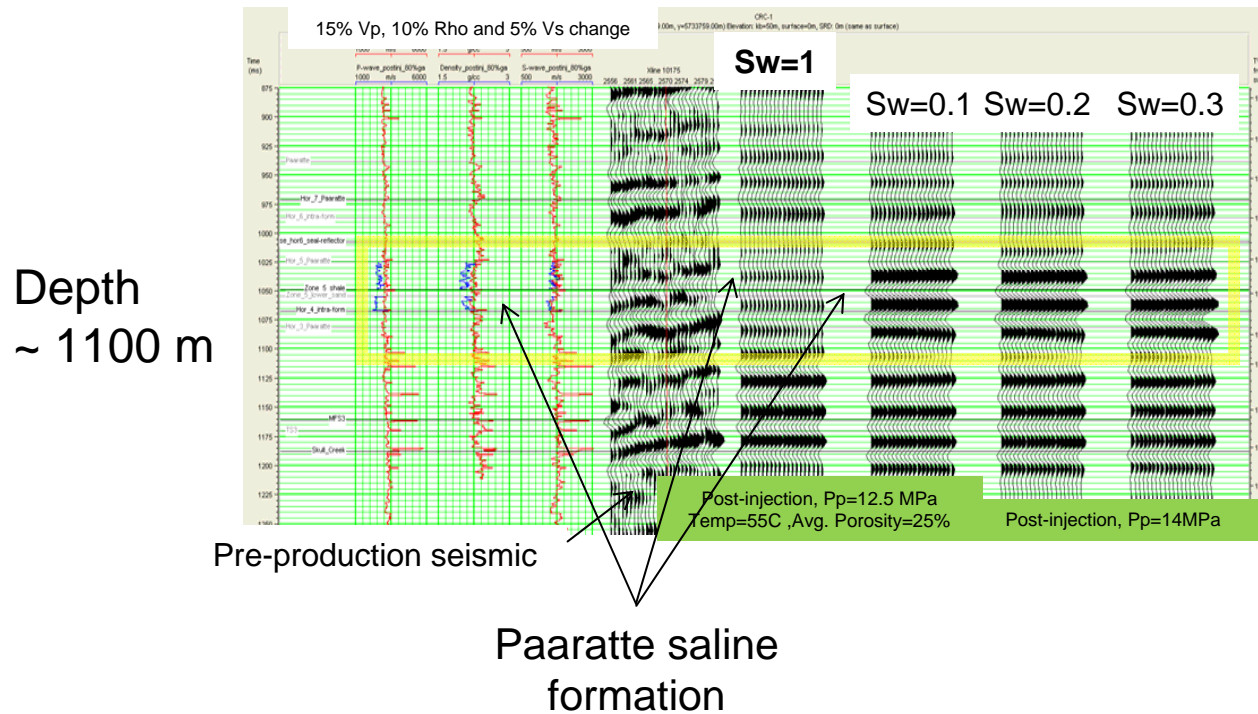

# 1D Modelling of CO<sub>2</sub> “leak” scenario

Upward migration of CO<sub>2</sub> into overlain strata (Paaratte saline aquifer 500 m above Naylor)

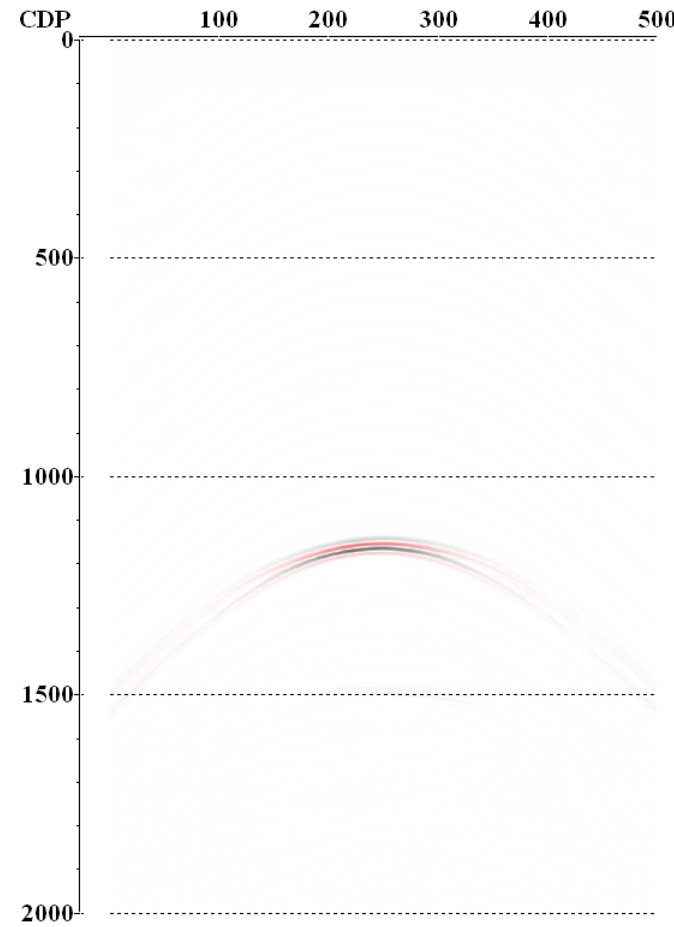

## Assurance monitoring

Very strong TL effect due to CO<sub>2</sub> accumulation in Paaratte!

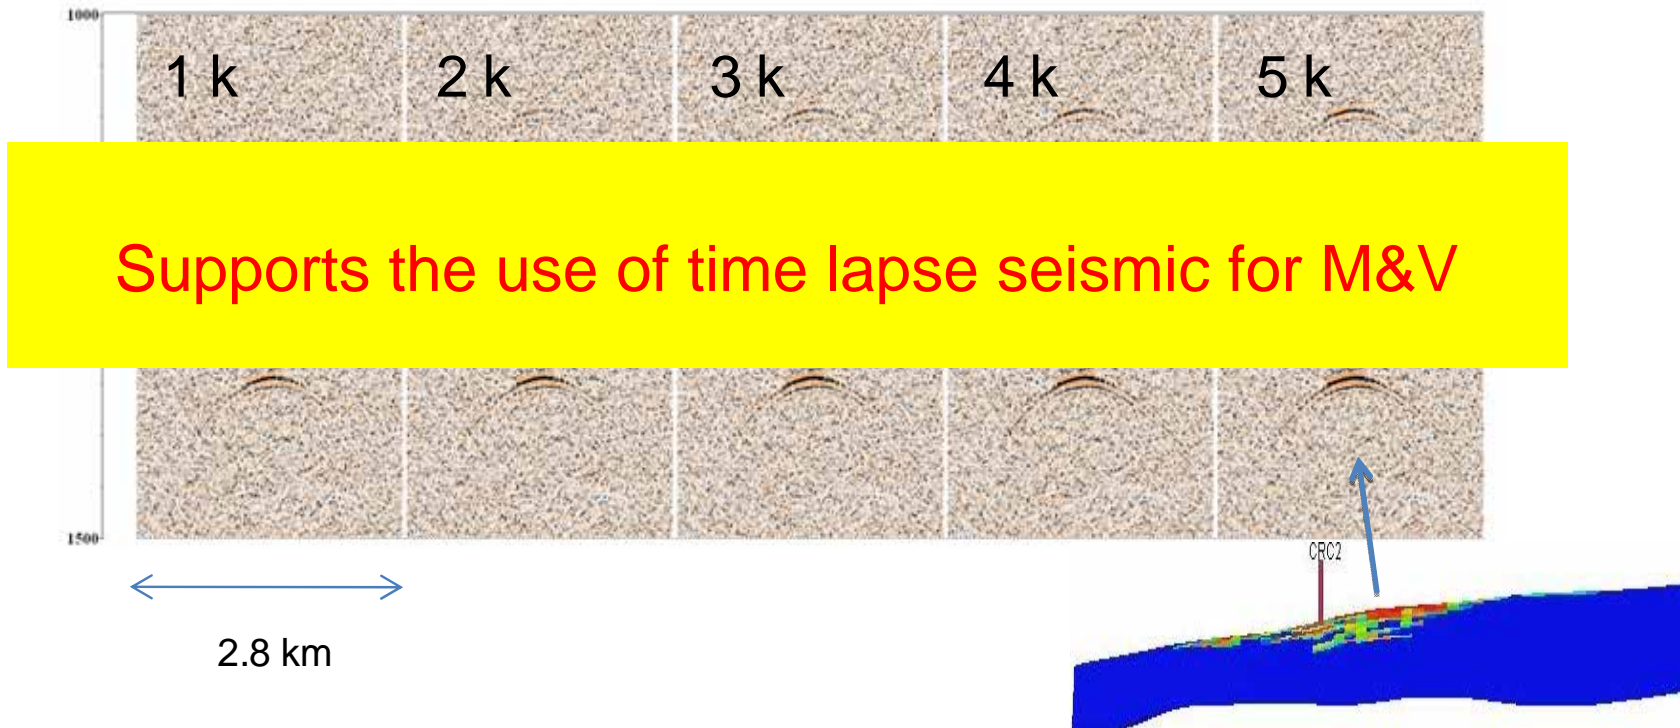

# 2D numerical modelling of small amount of CO2 present in Paaratte

Copyright CO2CRC

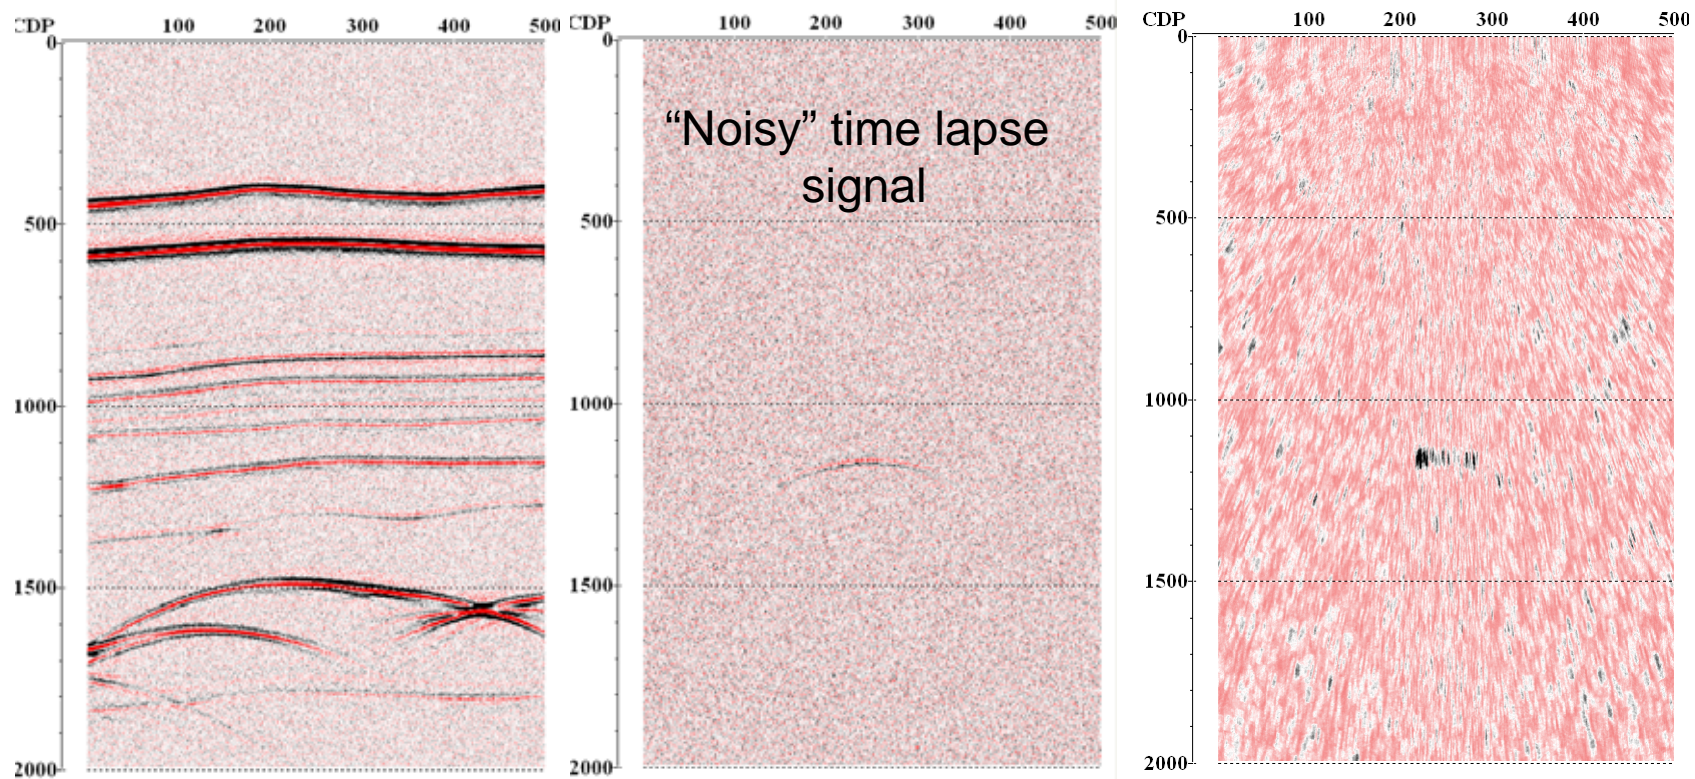

## 2D sensitivity modelling of a CO<sub>2</sub> “leak” into the Paaratte saline formation - model from reservoir simulation

The CO<sub>2</sub> quantities shown in thousand tonnes. CO<sub>2</sub> occupies thin layer, with small areal extent (less than Fresnel radius) - **diffracted energy is roughly proportional to CO<sub>2</sub> volume**; 30% of background noise.

# Application of diffracted wave analysis to leakage detection

4 Kt of CO<sub>2</sub> readily detectable

Copyright CO2CRC

# How can we monitor Stage I injection?

Need TL surveys that can achieve:

- High resolution
- High sensitivity
- Very good repeatability

Small target, small TL signal, traditionally poor repeatability of land seismic surveys

Other limitations: accessibility, environmental restrictions, cost, etc...

# Exploring around the site...

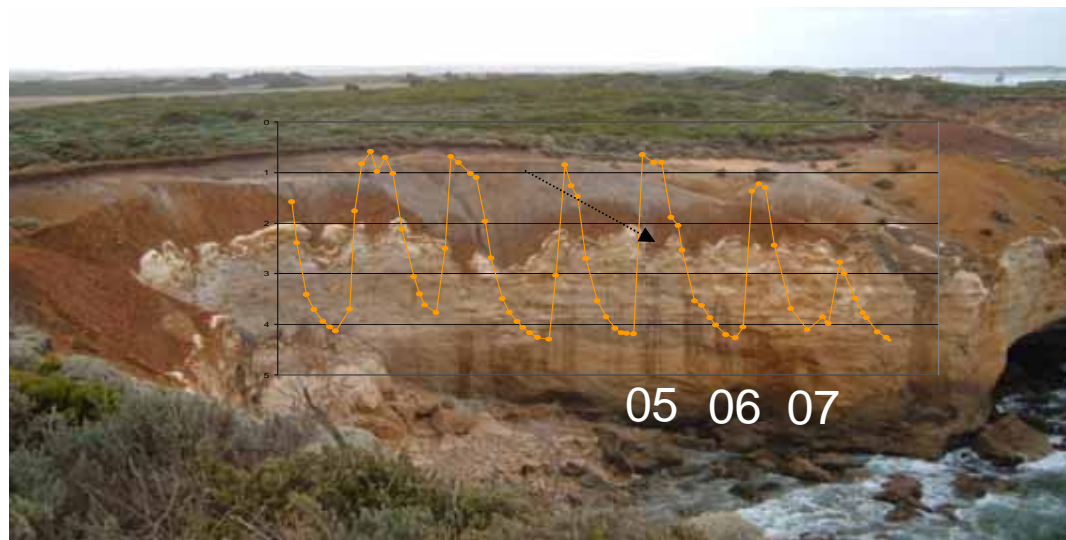

Copyright CO2CRC

# Key issue: Repeatability versus TL signal

Weathering conditions: top soil (farming zone) + weathered clay-rich zone on top of corrugated limestone

## Seasonal variation of Water Table

Variable scattering with WT variation

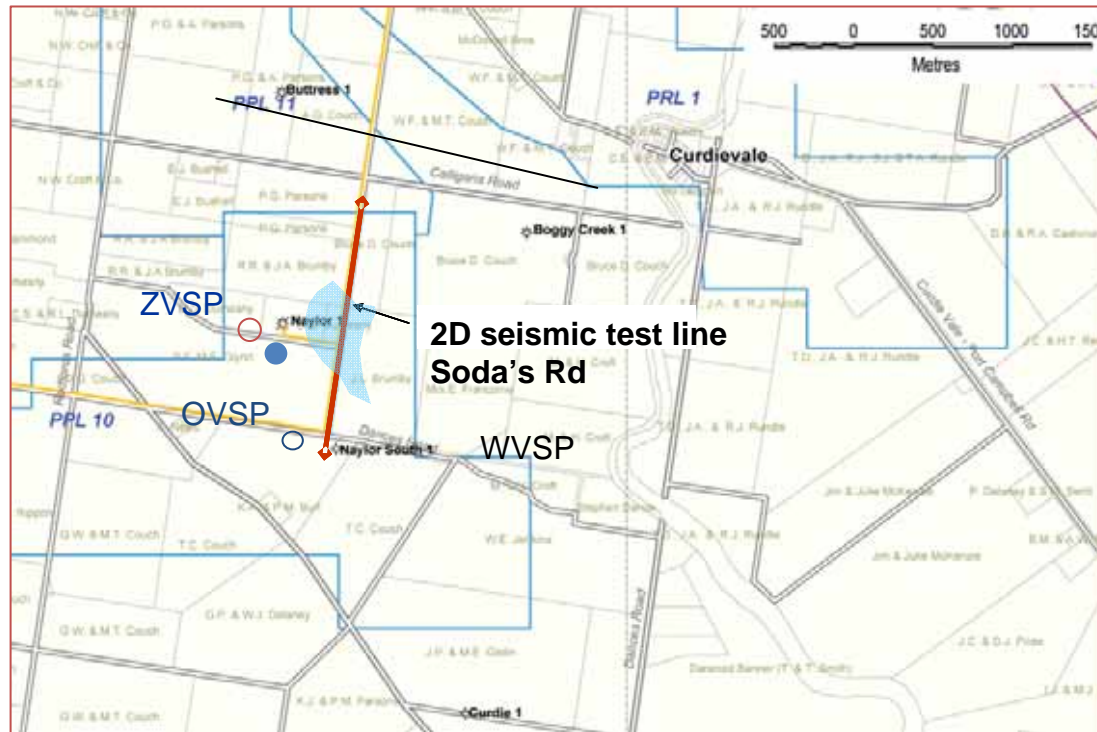

Copyright CO2CRC

# Pre baseline surveys

Repeatability and sensitivity tests  
(borehole and surface seismic program)

**Soda's Rd tests**  
**2D seismic test line**  
**Dry/wet conditions**  
**Different sources**  
**7 repeats**

**Objectives:** establish repeatability, performance of different sources, related energy loss, seasonal variation effects, survey logistics, accessibility, acquisition geometry, duration, cost, etc.

# Repeatability of TL seismic surveys: NRMS and S/N

$$NRMS = 200\% \frac{RMS(a - b)}{RMS(a) + RMS(b)}$$

where  $a$  and  $b$  are two surveys being compared [Kragh and Christie, 2002]

$$SN_i = \sqrt{\frac{[g_{i,i+1}]_{MAX}}{1 - [g_{i,i+1}]_{MAX}}}$$

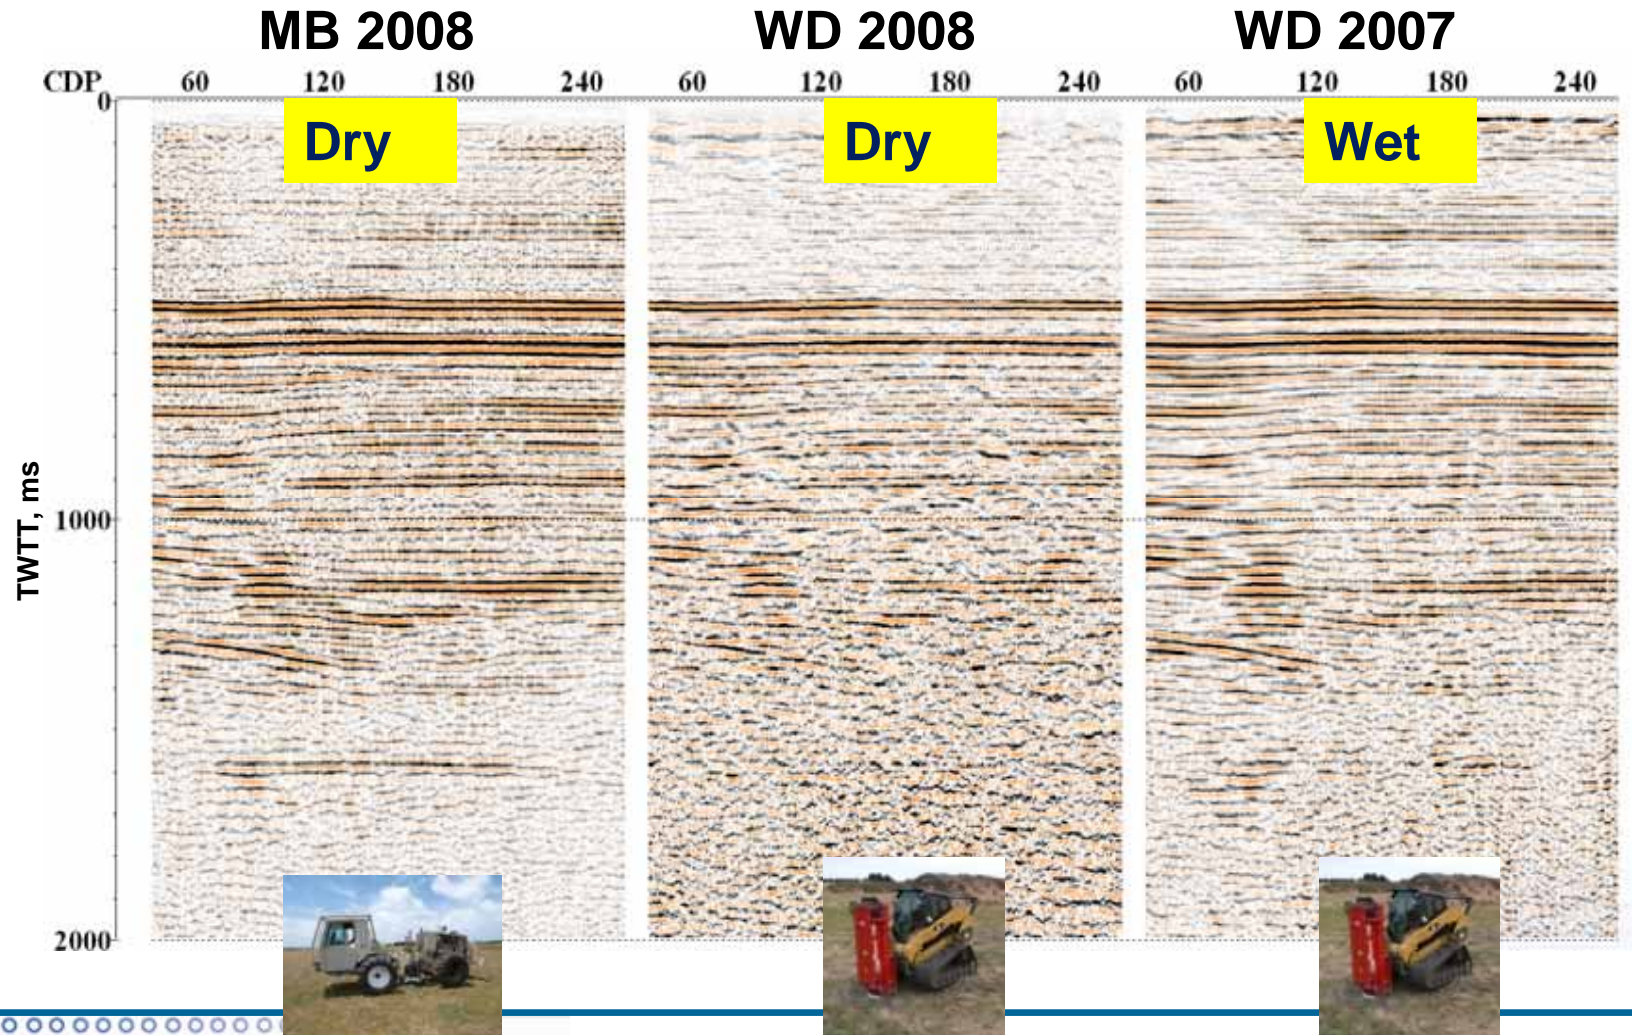

where  $i$  is trace number,  $g_{i,i+1}$  is normalized cross-correlation function between  $i$  and  $i+1$  traces and  $[g_{i,i+1}]_{MAX}$  is its maximum value

# 2D repeatability tests – soil saturation and source type

# Seismic monitoring – Final program

- **Time lapse 3D surface seismic**
  - Least sensitive and repeatable but provides coverage of entire reservoir and beyond
  - Necessary for ‘assurance monitoring’ to detect loss of primary containment
  - No 4D effect expected in general
- **Time lapse borehole seismic**
  - CRC-1: 3DVSP with 3C geophones (Schlumberger’s VSI)
    - Improved sensitivity and resolution relative to surface data, improved repeatability
    - More chance for direct CO<sub>2</sub> monitoring, limited coverage
  - Naylor-1: Permanent downhole sensors (LBNL)
    - Potentially most sensitive and repeatable

**Many farmers, electric fences, 1000000 cows...**

# Basic 3D processing flow-chart

- Data input and correlation for 2009
- Data equivalence and binning (bin size 10x10m)
- Elevation statics (30 m, 1800 m/s)
- Trace Editing
- Bandpass filtering (7-10-150-160 Hz)
- Spike and Burst Noise Attenuation
- Automatic gain control (500 ms, applied before deconvolution and removed after)
- Spiking Deconvolution (minimum phase for 2008 and zero-phase for 2009)
- Velocity Analysis (two iterations)
- Residual Static Correction
- Radon filter in cone window (AGC 500ms applied before and remove after)
- FX deconvolution before stack
- Normal Moveout Correction
- CDP stack
- Post-processing (TV Whitening, FXY Deconvolution)
- Explicit FD 3D Time Migration

# Conclusions

- Large number of unique TL data sets acquired (borehole and surface); inexpensive, good quality, acquired with small crews
- Numerous scientific studies and advances achieved
- Opportunity for further long-term cutting edge research and international collaboration

## Highlights

- Very good (post-stack) repeatability achieved combining weak and different source types, thanks to high spatial data density and high fold
- CO<sub>2</sub> upward migration (“Leak”) readily detectable with 3D TL seismic - no indication in TL data (using diverse measurements and studies)
- Clear, unique TL signal from Waarre-C not observed (CO<sub>2</sub> contained); very subtle TL signal – sensitive to processing/cross-equalisation schemes (analysis still ongoing)
- VSP shows superior repeatability and sensitivity with respect to surface seismic (also measure full wave field; possibility for development of alternative M&V methodologies)
